Python 3

```
1 class Person:
2     def __init__(self, initialAge):
3         # Add some more code to run some checks on initialAge
4         if initialAge < 0:
5             print("Age is not valid, setting age to 0.")
6             self.age = 0
7         else:
8             self.age = initialAge
9
10    def amIOld(self):
11        # Do some computations in here and print out the correct statement to the console
12        if self.age < 13:
13            print("You are young.")
14        elif self.age < 18:
15            print("You are a teenager.")
16        else:
17            print("You are old.")
18
19    def yearPasses(self):
20        # Increment the age of the person in here
21        self.age += 1
22
23 > t = int(input()) ...
```

✓ Test case 0

✓ Test case 1

✓ Test case 2

Compiler Message

Success

Input (stdin)

```
1 4
2 -1
3 10
4 16
5
6 18
```

Expected Output

```
1 Age is not valid, setting age to 0.
2 You are young.
```

C#

```
> using System; ...

class Person {
    public int age;
    public Person(int initialAge) {
        // Add some more code to run some checks on initialAge
        if (initialAge < 0) {
            Console.WriteLine("Age is not valid, setting age to 0.");
            age = 0;
        } else {
            age = initialAge;
        }
    }
    public void amIOld() {
        // Do some computations in here and print out the correct statement to the console
        if (age < 13) {
            Console.WriteLine("You are young.");
        } else if (age < 18) {
            Console.WriteLine("You are a teenager.");
        } else {
            Console.WriteLine("You are old.");
        }
    }
    public void yearPasses() {
        // Increment the age of the person in here
        age++;
    }
}

> static void Main(String[] args) { ...
```
